

12 Smartphone Photography Tips

Lets
Get
Started!

1 Wipe any fingerprints off your lens.

2 Set your phone to take high quality photos, by default most phones are set to medium.

3 Use the right camera setting for each photo like portrait, sports, burst mode or hdr.

4 Don't forget about good photo composition: Rule of thirds, lines drawing eyes to subject, etc.

5 Tap the screen to pick what you want in focus.

6 Hold camera steady! Lean against wall, table, or use a holder/tripod.

7 Less light means longer shutter speeds and increases need to hold the camera steady.

9 Getting closer is **better than** using zoom.

8 Have enough light or use flash if subject is backlit.

10 Use camera apps that have built-in timers anti-shake, smile and open eyes recognition, or that can take photos when you whistle.

11 Use the back of the camera lens and not the front when possible.

12 Edit your photos on your computer afterwards to crop, sharpen and add any special effects.
